1 Project Idea

Language modeling is the task of predicting the next word or character given all previous words. GPT-2, the successor of GPT [1] trained by OpenAI [1] using 40GB Internet text data, is the state-of-the-art language model to perform such task. It is a transformer-based model with four variations of model size (number of parameters): 124M, 355M, 774M, and 1558M

Our mission in this project is to

2 Dataset Description

3 Input-Output Behavior

4 Evaluation Metrics
